INTRODUCTION

Whole sediment toxicity testing was conducted on sediment samples collected from the Hackensack Meadowlands in Bergen and Hudson Counties, New Jersey. Whole sediment toxicity testing was conducted 1 through 29 October 2003 using the freshwater amphipod, *Hyalella azteca* (*H. azteca*). Whole sediment toxicity testing was conducted 3 through 13 October 2003 using the freshwater midge, *Chironomus tentans* (*C. tentans*). Whole sediment toxicity testing was conducted 12 through 22 October 2003 using the marine annelid, *Neanthes arenaceodentata* (*N. arenaceodentata*). The samples were collected by ENSR International, Inc. personnel and transported to B-H Laboratories' Spring City, Pennsylvania laboratory. The objective of this testing was to determine chronic toxicity of the sediments to *H. azteca*, *C. tentans* and *N. arenaceodentata*.

The NJMC/MERI proposed to assess the ecological risks from contamination from wetland sites throughout the Meadowlands. The data generated from these studies is part of a larger study that will help guide future decisions about acquisition and restoration of the Meadowlands wetlands.

All testing was conducted in accordance with procedures outlined in Ingersoll, C.G., G.T. Ankley, G.A. Burton, F.J. Dwyer, R.A. Hoke, T.J. Norbert-King and P.V. Winger. 1994. *Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates*. EPA/600/R-99/064. U.S. EPA Office of Research and Development, Duluth, MN, ASTM. 1995. *Standard Test Methods for Measuring the Toxicity of Sediment-Associated Contaminants with Fresh Water Invertebrates*. E1706-95. American Society for Testing and Materials, Philadelphia, PA and ASTM. 1994. *Standard Guide for Conducting Sediment Toxicity Tests with Marine and Estuarine Polychaetous Annelids*. E1611-94. American Society for Testing and Materials, Philadelphia, PA.

MATERIALS

TEST ORGANISMS

Freshwater Amphipod, *Hyalella azteca* (10-ppt)

Immature *H. azteca* (13-days old) used in testing were obtained from Aquatic Research Organisms (ARO), a commercial culture facility located in Hampton, New Hampshire. This species is a representative invertebrate and a United States Environmental Protection Agency (EPA) accepted test organism. The amphipods used for testing were hatched on 18 September 2003 and held at the culture facility until shipment on 30 September 2003. The amphipods were acclimated to a salinity 10-ppt prior to shipping to B-H Laboratories Biological Services Division. The amphipods were acclimated over a five-day period (26 through 30 September 2003) at an exchange rate of 2-ppt per 24-hour period. Prior to shipping, the amphipods were fed Tetra Fin flake food during acclimation and holding at ARO. The amphipods were placed in a plastic cubitainer with 10-ppt seawater and shipped overnight to B-H Laboratories' Biological Services Division in Spring City, Pennsylvania. The amphipods were received at B-H Laboratories on 1 October 2003. Upon receipt at B-H Laboratories, the amphipods were inspected for mortality and transferred to several 2-liter crystallizing dishes. The amphipods were fed YCT and gentle aeration was provided to the crystallizing dish. The amphipods were acclimated to the overlying water by partial replacements with 10-ppt seawater. Amphipods were fed 1.0-mL YCT daily during the test, unless otherwise noted (see Daily Observation Data Sheets, Appendix A). The amphipods were held in 10-ppt seawater until test initiation.

Freshwater Amphipod, *Hyalella azteca* (moderately-hard reconstituted water)

Immature *H. azteca* (13-days old) used in testing were obtained from Aquatic Research Organisms (ARO), a commercial culture facility located in Hampton, New Hampshire. This species is a representative invertebrate and a United States Environmental Protection Agency (EPA) accepted test organism. Prior to shipping, the amphipods were fed Tetra Fin flake food during acclimation and holding at ARO. The amphipods were placed in a plastic cubitainer with moderately-hard reconstituted water and shipped overnight to B-H Laboratories' Biological Services Division in Spring City, Pennsylvania. The amphipods were received at B-H Laboratories on 1 October 2003. Upon receipt at B-H Laboratories, the amphipods were inspected for mortality and transferred to several 2-liter crystallizing dishes. The amphipods were fed YCT and gentle aeration was provided to the crystallizing dish. The amphipods were acclimated to the overlying water by partial replacements with moderately-hard reconstituted water. Amphipods were fed 1.0-mL YCT daily during the test, unless otherwise noted (see Daily Observation Data Sheets, Appendix A). The amphipods were held in moderately-hard reconstituted water until test initiation.

Larval Midge, *Chironomus tentans*

C. tentans larvae (14-days old, 2nd to 3rd instar) used in testing were obtained from Aquatic Research Organisms (ARO), a commercial culture facility located in Hampton, New Hampshire. This species is a representative invertebrate and United States Environmental Protection Agency (EPA) accepted test organism. Prior to shipping, the amphipods were fed rabbit pellets during acclimation and holding at ARO. Midge larvae (14-days old) were placed in a plastic cubitainer with moderately hard re-constituted water and shipped overnight to B-H Laboratories' Biological Services Division in Spring City, Pennsylvania. The midges were received at B-H Laboratories on 3 October 2003. Upon receipt at B-H Laboratories, the midge larvae were inspected and transferred to 2-liter crystallizing dishes. A gentle aeration was provided. The midges were acclimated to the overlying water by partial replacements with moderately hard re-constituted water. Midges were fed 1.5-mL of Tetra-Min slurry daily during the test, unless otherwise noted (see Daily Observation Data Sheets, Appendix A). The midges were held in moderately hard re-constituted water until test initiation.

Marine Annelid, *Neanthes arenaceodentata*

N. arenaceodentata (two to three weeks old) used in testing were obtained from California State University at Long Beach, a non-commercial culture facility located in Long Beach, California. This species is a representative invertebrate and United States Environmental Protection Agency (EPA) accepted test organism. Annelids were placed in a plastic cubitainer with 25-ppt seawater and shipped overnight to B-H Laboratories' Biological Services Division in Spring City, Pennsylvania. The annelids were received at B-H Laboratories on 12 October 2003. Upon receipt at B-H Laboratories, the annelids were inspected and transferred to 2-liter crystallizing dishes. A gentle aeration was provided. The annelids were acclimated to the overlying water by partial replacements with 25-ppt seawater. Annelids were not fed during the test. The annelids were held in 25-ppt seawater until test initiation.

NEGATIVE CONTROL SEDIMENT

Sediment to be used as the negative controls was collected from Blue Marsh Reservoir located in Lower Heidelberg, Pennsylvania. The sediment was collected on 25 September 2003 and transported to the Spring City laboratory. The sediments were collected from a cove south of the boat launch. The sediments were collected approximately five-feet from the shoreline in two-feet of water.

Control sediment was collected by B-H Laboratories personnel and placed in a 5-gallon plastic bucket with high-density polyethylene liners. The sediment was covered with overlying water from the reservoir and sealed with the liner and a plastic lid. B-H Laboratories personnel transported the sediment to the Spring City, PA office on the day of collection. Chain-of-Custody forms accompanied all sediments. Prior to use, the control sediments were homogenized and sieved through a no. 6 (3.35-mm) stainless steel sieve to remove large pebbles, stones, twigs and plant clumps.

TEST SEDIMENTS

Sediments were collected on 15 through 17 September 2003 by ENSR International, Inc. personnel. The sediments were identified as sediment no(s). RBM-01, RBM-02, SHS-01, SHS-02, SAW-01, SAW-02, SAW-03, ORM-01, ORM-02, KFM-01, KFM-02 and KFM-03. Sediment samples were picked up at ENSR International's Piscataway, New Jersey office by B-H Laboratories' personnel and transported to B-H Laboratories' Spring City office on 15, 16 and 17 October 2003. Chain-of-Custody forms accompanied all sediments. All sediments were stored at 1° to 4.4°C in their original containers when not being used. Sediments were warmed to test temperature prior to test initiation. Prior to use, the sediments were homogenized and sieved through a no. 6 (3.35-mm) stainless steel sieve to remove large pebbles, stones, twigs and plant clumps.

OVERLYING WATER

Moderately-Hard Reconstituted Water

Reconstituted water is prepared in accordance to procedures outlined in EPA/600/R-99/064 to be used as acclimation and overlying water for the toxicity tests. Water is decanted through a mixed bed de-ionizing system (U. S. Filter, Inc.) consisting of carbon, mixed resin-bed and membrane filters. A 190-liter Nalgene tank is filled with about 150-liters of de-ionized water. In a five-gallon bucket of de-ionized water, 9.5-grams of CaSO₄ and 9.5-grams CaCl₂ is mixed into solution by vigorously aerating for 30-minutes or until the salts dissolve.. Into a second 5-gallon bucket of de-ionized water, 5.7-grams of MgSO₄, 18.2-grams of NaHCO₃ and 0.76-grams KCl is mixed by aerating for 30-minutes or until the salts dissolve. The two five-gallon aliquots are added to the 150-liters of de-ionized water and the volume is brought to 190-liters with de-ionized water. Reconstituted water is aerated for at least 24-hours prior to use.

10-ppt

Natural seawater was collected at the Manasquan Inlet in Brielle, New Jersey. Manasquan Inlet is a New Jersey Department of Environmental Protection approved site for the collection of natural seawater used for testing. The seawater was collected on 24 September 2003 by B-H laboratories personnel. The seawater that was collected had a salinity of 32-ppt. The 10-ppt seawater is prepared by filtering the natural seawater through a 0.5- μm polypropylene string-wound cartridge filter. The natural seawater is adjusted to 10-ppt by incremental additions of de-ionized water. The water is aerated for 24-hours. After aerating for 24 hours, the salinity is measured and the salinity is adjusted either by adding additional seawater or de-ionized water. The water is aerated an additional 24-hours prior to use as acclimation or overlying water. Natural 10-ppt salt water is prepared in 190-liter batches.

25-ppt

Natural seawater was collected at the Manasquan Inlet in Brielle, New Jersey. The seawater was collected on 24 September 2003 by B-H laboratories personnel. The 25-ppt seawater is prepared by filtering the natural seawater through a 0.5- μm polypropylene string-wound cartridge filter. The natural seawater is adjusted to 25-ppt by incremental additions of de-ionized water. The water is aerated for 24-hours. After aerating for 24 hours, the salinity is measured and the salinity is adjusted either by adding additional seawater or de-ionized water. The water is aerated an additional 24-hours prior to use as acclimation or overlying water. Natural 25-ppt salt water is prepared in 190-liter batches.

METHODS

***HYALELLA AZTECA*, 28-DAY WHOLE SEDIMENT TOXICITY TEST METHOD (10-ppt)**

Sediments were warmed to test temperature prior to test initiation. The day prior to test initiation, 100-mL of sediment and 175-mL of overlying water (10-ppt seawater) was placed into the each test chamber. Renewal of overlying water was begun 24-hours prior to introduction of the test organisms. *H. azteca* (13-days old) were exposed to the sediment under static renewal conditions for 28-days. The amphipods were exposed in-groups of ten in 300-mL high-form lip-less Kimax beakers with eight replicates per sample (80 amphipods per sample). Test chambers were placed in a temperature controlled environmental chamber maintained at $23 \pm 1^\circ\text{C}$. Negative control sediments were also tested.

Test organisms were fed 1.0-mL YCT suspension daily unless otherwise noted on the raw data sheets. Water renewals were accomplished by siphoning off the old solution and replacing it with fresh overlying water twice daily (A.M. and P.M.). Dead organisms observed during the renewal process were removed and recorded. Dissolved oxygen and pH were measured daily in the fresh overlying water. Temperature, dissolved oxygen, pH and conductivity were measured in the pooled replicates after each 24-hour exposure period. Alkalinity and hardness were measured in the overlying water on day 0. Ammonia was measured in the pooled replicates from each sample on days 0, 14, and 28. The lighting regime was 16-hours light, 8-hours dark using cool white fluorescent lights.

The test was terminated at the end of 28-days. Surviving amphipods within each replicate were collected with a U.S. Standard No. 50 stainless steel sieve. The amphipods were counted, rinsed with de-ionized water and transferred as a group to pre-weighed pans. The number of surviving amphipods was recorded on the *Hyalella azteca* Weight Data sheet. Amphipods were dried in an oven at 100°C for at least eight hours and then transferred to a desiccator. Each pan containing amphipods was weighed to the nearest 0.01-mg on an Ohaus Model AP250D Plus analytical balance. The total amphipod dry weight was divided by the number of surviving amphipods to obtain the average amphipod weight (growth) per replicate. In addition, the total dry weight divided by the initial number of amphipods (biomass) was calculated and included in Appendix B of this report.

***HYALELLA AZTECA*, 28-DAY WHOLE SEDIMENT TOXICITY TEST METHOD (Moderately-Hard Reconstituted Water)**

Sediments were warmed to test temperature prior to test initiation. The day prior to test initiation, 100-mL of sediment and 175-mL of overlying water (moderately-hard reconstituted water) were placed into the each test chamber. Renewal of overlying water was begun 24-hours prior to introduction of the test organisms. *H. azteca* (13-days old) were exposed to the sediment under static renewal conditions for 28-days. The amphipods were exposed in-groups of ten in 300-mL high-form lip-less Kimax beakers with eight replicates per sample (80 amphipods per sample). Test chambers were placed in a temperature controlled environmental chamber maintained at $23 \pm 1^{\circ}\text{C}$. Negative control sediments were also tested.

Test organisms were fed 1.0-mL of YCT suspension daily unless otherwise noted on the raw data sheets. Water renewals were accomplished by siphoning off the old solution and replacing it with fresh overlying water renewed overlying water twice daily (A.M. and P.M.). Dead organisms observed during the renewal process were removed and recorded. Dissolved oxygen and pH were measured daily in the fresh overlying water. Temperature, dissolved oxygen, pH and conductivity were measured in the pooled replicates after each 24-hour exposure period. Alkalinity and hardness were measured in the overlying water on day 0. Ammonia was measured in the pooled replicates from each sample on days 0, 14, and 28. The lighting regime was 16-hours light, 8-hours dark using cool white fluorescent lights.

The test was terminated at the end of 28-days. Surviving amphipods within each replicate were collected with a U.S. Standard No. 50 stainless steel sieve. The amphipods were counted, rinsed with de-ionized water and transferred as a group to pre-weighed pans. The number of surviving amphipods was recorded on the *Hyalella azteca* Weight Data sheet. Amphipods were dried in an oven at 100°C for at least eight hours and then transferred to a desiccator. Each pan containing amphipods was weighed to the nearest 0.01-mg on an Ohaus Model AP250D Plus analytical balance. The total amphipod dry weight was divided by the number of surviving amphipods to obtain the average amphipod weight (growth) per replicate. In addition, the total dry weight divided by the initial number of amphipods (biomass) was calculated and included in Appendix B of this report.

***CHIRONOMUS TENTANS*, 10-DAY WHOLE SEDIMENT TOXICITY TEST METHOD**

Sediments were warmed to test temperature prior to test initiation. The day prior to test initiation, 100-mL of sediment and 175-mL of overlying water (moderately hard-reconstituted water) was placed into the each test chamber. Renewal of overlying water was begun 24-hours prior to introduction of the test organisms. *C. tentans* (less than 24-hours old) were exposed to the sediment under static renewal conditions for 10-days. The midges were exposed in-groups of ten in 300-mL high-form lip-less Kimax beakers with eight replicates per sample (80 midges per sample). Test chambers were placed in a temperature controlled environmental chamber maintained at $23 \pm 1^{\circ}\text{C}$. Negative control sediments were also tested.

Test organisms were fed 1.5-mL of Tetra-min® slurry daily unless otherwise noted on the raw data sheets. Water renewals were accomplished by siphoning off the old solution and replacing it with fresh overlying water renewed overlying water twice daily (A.M. and P.M.). Any dead organisms observed during the renewal process were removed and recorded. Dissolved oxygen and pH were measured daily in the fresh overlying water. Temperature, dissolved oxygen, pH and conductivity were measured in the pooled replicates after each 24-hour exposure period. Alkalinity and hardness were measured in the overlying water on day 0. Ammonia was measured in the pooled replicates from each sample on days 0 and 10. The lighting regime was 16-hours light, 8-hours dark using cool white fluorescent lights.

The test was terminated at the end of 10-days. Surviving *C. tentans* within each replicate were collected with a U.S. Standard No. 50 stainless steel sieve. The midges were counted, rinsed with de-ionized water and transferred as a group to pre-weighed pans. The number of surviving midges was recorded on the *Chironomus tentans* Weight Data sheet. Midges are dried in an oven at 100° C for at least eight hours and then transferred to a desiccator. Each pan containing midges was weighed to the nearest 0.01-mg on an Ohaus Model AP250D Plus analytical balance. The pans were transferred to a muffle furnace at ashed at 550° C for at least two hours and then transferred to the desiccator. The pans containing midges were re-weighed to the nearest 0.01-mg on an Ohaus Model AP250D Plus analytical balance. The tissue mass of the larvae is determined as the difference between the weight of the dried larvae plus pan and the weight of the ashed larvae plus pan.

***NEANTHES ARENACEODENTATA*, 10-DAY WHOLE SEDIMENT TOXICITY TEST METHOD**

Sediments were warmed to test temperature prior to test initiation. The day prior to test initiation, 200-mL of sediment and 800-mL of overlying water (25-ppt seawater) was placed into the each test chamber. Renewal of overlying water was begun 24-hours prior to introduction of the test organisms. *N. arenaceodentata* (two to three weeks old) were exposed to the sediment under static renewal conditions for 10-days. The annelids were exposed in-groups of five in 1000-mL Kimax beakers with eight replicates per sample (40 annelids per sample). Test chambers were placed in a temperature controlled environmental chamber maintained at 20 ± 1°C. Negative control sediments were also tested.

Test organisms were not fed during the test. Water renewals were accomplished by siphoning off the old solution and replacing it with fresh overlying water renewed overlying water twice daily (A.M. and P.M.). Any dead organisms observed during the renewal process were removed and recorded. Dissolved oxygen and pH were measured daily in the fresh overlying water. Temperature, dissolved oxygen, pH and conductivity were measured in the pooled replicates after each 24-hour exposure period. Alkalinity and hardness were measured in the overlying water on day 0. Ammonia was measured in the pooled replicates from each sample on days 0 and 10. The lighting regime was 16-hours light, 8-hours dark using cool white fluorescent lights.

The test was terminated at the end of 10-days. Surviving *N. arenaceodentata* within each replicate was collected with a U.S. Standard No. 50 stainless steel sieve. The annelids were counted, rinsed with de-ionized water and transferred as a group to pre-weighed pans. The number of surviving annelids was recorded on the *N. arenaceodentata* Weight Data sheet. Annelids are dried in an oven at 100° C for at least eight hours and then transferred to a desiccator. Each pan containing midges was weighed to the nearest 0.01-mg on an Ohaus Model AP250D Plus analytical balance. The total annelid dry weight was divided by the number of surviving amphipods to obtain the average amphipod weight (growth) per replicate. In addition, the total dry weight divided by the initial number of annelids (biomass) was calculated and included in Appendix B of this report.

STATISTICAL ANALYSES

Statistical comparisons for the toxicity testing were performed between the negative control and site sediments to identify statistically significant differences in survival. Arc-sine transformed survival data were tested for normal distribution using either Shapiro-Wilk's Test or Kolmogorov D Test. Survival data were tested for equality of variance using Bartlett's Test. If the data met the assumptions for normality and equality of variance, the parametric Analysis of Variance (ANOVA)/Dunnett's Test was used to identify significant differences in survival between the test samples and reference sediments. If these assumptions were not met, the non-parametric Steel's Many-One Rank Test was used to identify significant differences in survival between the test samples and reference sediments. A summary of survival data for *H. azteca*, *C. tentans* and *N. arenaceodentata* can be found in Tables 1a through 6a.

Statistical comparisons for the toxicity testing were performed between the negative control and site sediments to identify statistically significant differences in growth. Non-transformed growth data were tested for normal distribution using either Shapiro-Wilk's Test or Kolmogorov D Test. Growth data were tested for equality of variance using Bartlett's Test. If the data met the assumptions for normality and equality of variance, the parametric Analysis of Variance (ANOVA)/Dunnett's Test was used to identify significant differences in survival between the test samples and reference sediments. If these assumptions were not met, the non-parametric Steel's Many-One Rank Test was used to identify significant differences in survival between the test samples and reference sediments.

A summary of growth data for *H. azteca*, *C. tentans* and *N. arenaceodentata* can be found in Tables 1a through 4b.

12 through 22 October 2003

Sample Identification	P/Chem Parameter	Day 1	Day 2	Day 3	Day 4	Day 5	Day 6	Day 7	Day 8	Day 9	Day 10
	Temperature	20.3	20.4	20.6	20.7	20.6	20.1	20.3	20.3	20.3	20.0
	Initial D.O.	7.8	8.7	7.4	7.1	7.3	6.8	6.9	7.3	7.1	7.2
	Final D.O.	5.7	5.9	5.9	5.5	5.7	4.0	6.1	6.3	5.7	5.9
Negative Control 25 ppt	Initial pH	8.01	8.04	7.93	7.88	7.83	7.84	7.95	7.94	7.86	7.73
	Final pH	7.65	7.66	7.64	7.62	7.57	7.34	7.67	7.67	7.51	7.43
Blue Marsh Reservoir	Conductivity	35380	35070	35470	36210	36280	36640	36460	36080	35700	35640
	Salinity (ppt)	24.5	24.5	24.6	24.9	24.7	24.8	24.9	25.5	24.4	24.5
	Ammonia	0.6									<0.6
